

REMOTE WHATSAPP

Q1. what is this application?

This script is whatsapp script that use python.it is made by Tarek Galal

<tare2.galal@gmail.com> MIT License.name is yowsup-master .

I modified this script and name it REMOTE WHATSAPP .In this script I add some module that help administrator or normal user to control linux os by whatsapp only by sending command.it is a beta version.

Q2. module added by me?

1. Shutdown: u can shut down by sending command Shutdown.
2. Restart: u can restart by sending command Restart.
3. Suspend:u can suspend by sending command Suspend.
4. Screenshot:u can take screenshot by sending command Screenshot.
5. Screenshot50:u can take screenshot by sending command Screenshot50.it take 50 screenshot continuouslt in 5 sec gap.
6. Screenlock: u can screenlock by sending command shutdown.
7. Keylogger: u can install keylogger.it can monitor your laptop when other one using it. u not at home and some one using it u only send command and start keylogger.

Q3. how to setup whatsapp?

1.download remote whatsapp folder in root directory.in this folder yowsup-master folder copy it to root directory.

1. "install.sh" script is give in the remote whatsapp folder.make it executable

Chmod +x install.sh

2. run this script and install dependencies.

./install.sh

3.cd yowsup-master/src

4.nano config.example

here u find this

cc=91

phone=91your mobile number to register for whatsapp<no. With no whatsapp>

id=

password=

5.chmod +x yowsup-cli

6. ./yowsup-cli --requestcode sms --config config.example

u get something like this:

status:sent

length:6

method:sms

7. u get a code in your number u give above..it is like u register for whatsapp in your phone

./yowsup-cli --register 123-456 --config config.example

8.now u get password on your screen.open another terminal go to /yowsup-master/src and open config.example and type your password .

Actual config starts below

cc=
phone=
id=
password= your password

9. your whatsapp now set up.

10. open run.sh script and in other number place write the number from which u can send your command.

Q4. how to configure KEYLOGGER??

I use logkeys-0.1.1 as a keylogger. Logkeys is a Linux keylogger. It is more updated than any other available keylogger, Moreover logkeys don't crash the X server, and appears to work in all the situations. Logkeys creates a log of all characters and function keys. Moreover logkeys are aware of Alt and Shift and works well with serial as well as USB keyboards.

1. *extract logkeys*

tar -xvzf logkeys-0.1.1a.tar.gz

2. *go to logkeys folder*

cd logkeys-0.1.1a

3. *./configure*

4. *make*

5. *sudo make install*

6. *sudo locale-gen*

Usages of logkeys:

logkeys s : Start logging keypress.

logkeys k : Kill logkeys process.

Check the log file which by default is '/var/log/logkeys.log'.

nano /var/log/logkeys.log

Q5. how to start script automatically?

Open terminal and type
`crontab -e`

and at last type this.give run.sh script path here but before this it is important it run.sh is executable.

`@reboot /root/yowsup-master/src/run.sh`

Q6. what command I can send from whatsapp and command working?

Shutdown

Restart

Suspend

Screenlock

this commands help you when you are away from your laptop. Let take a scenario u r not at home and someone want your pc or use your pc or u download something..by sending this command u can control your pc.more commands

Screenshot

Screenshot50

this commands help you to take screenshot when someone using your laptop.Screenshot50 take 50 screenshot in 5sec interval.

All these screenshot save to /root/yowsup-master/src/.screenshot

Logkeys -s

this is a keylogger command to start keylogger .

Logkeys -k

this is a keylogger command to stop the keylogger.

Note: first letter is always capital of whatsapp command like Screenshot 'S' is capital.otherwise not working.

Hope you like my work .this is beta version .i try to send reply and more feature to your whatsapp..u can see power status and many more feature at your whatsapp.
